SYSTEM *99* ~ SKYE CHAIR FAST LIFTING METHOD / WITH HELP FROM A CO-WORKER LOCATED BELOW

(1) = Free-Side rope, (2) = Handle, (3) = Halved ~ Handle Securing Rope.

Because the occupant of the Chair is limited to about two feet of upward handle [slide-reach] when doing self-lifting the [up] progress may be too slow for you.

With a co-worker pulling the chair up from below the travel progress will be greatly accelerated.

A second handle is best, but if you only have one, the worker in the chair takes it with him, as pictured to the left.

As the co-worker below pulls down on the rope, the worker in the chair [**firmly**] holds the handle, allowing the rope to pass down.

The handle will automatically allow the rope to pass down through the rope travel housing slot / [or] you can hold the rope travel release lever open. **DO NOT OPEN THE SAFETY RELEASE LEVER.**

And, under [NO] circumstances, take the handle off the rope.

Once the chair reaches the spot where he will stop & work, the worker in the chair takes over and makes final height adjustments himself.

Once he is in position, he slides the handle up the free-side rope until the handle securing rope is taught. At this point, he is tied off so he can let go of the handle and have both hands free for his work.
